

Core Security Weekly Status Meeting Minutes

9-02-14

Notes

- Need to better understand Keystore and if there are any implications to existing APIs
- Discussed the dependencies listed by Technicolor. QCE agreed that the dependent items would be at a "development complete" level which means that the components are fully coded but not tested
- Technicolor believes they can be feature complete along with automated tests. Final testing would take 3 weeks.
 - This may be tight - we should explore the option of putting Technicolor's items into 14.12
- Could security manager be release as a service separate from Core? Technicolor needs to look at the earliest time they can begin integration. This is an agreeable option.
 - This would imply that all of QCE Security 2.0 work be included into 14.12
 - Technicolor would assist with Core release testing
 - May need a separate meeting after next week to coordinate testing
- Need to discuss how to coordinate the automated testing
- Sufficient soak time is needed for security before adding to a release

Proposed agenda for next week's call

- Each contributing team to discuss their scheduling activities
 - Each team is encouraged to post their schedule to the Core WG mail list prior to the meeting
